## Error while starting Black Ops 2. Go back to main menu

A: I've solved it. Thought I'd post my solution for anybody who came across the same problem. The answer lies in two places. You can't run custom native apps as a service. The native app runs without crashing but it does not show up in the Task Manager. That's why I did not see it. Original question Error during initialization: Missing config file "default.cfg" during Does not say much. As far as I can tell it appears to be a Black Ops 2 problem. But there is a post with the same problem post from 2012 but the solution is missing Looking at the original post the solution lies in the first comment. and it works! I post this answer as I have a similar error (missing cfg file) and I did manage to fix it. Posting here because I think it might help someone with the same error as I do. I also recommend these guys. The answer lies in two places. You can't run custom native apps as a service. The native app runs without crashing but it does not show up in the Task Manager. That's why I did not see it.

Solution: HKEY\_CURRENT\_USER\Software\Microsoft\Windows\CurrentVersion\Run

Create a new string value "Python.exe" and set its value to

"%appdata%\Packages\Python-3.4.3\python.exe" -m app. Reference: Egin güzel bugünlerde Microsoft Windows üzerinden Python uygulamayı yürüten bir devirde, Windows

10 veri bit görüntülemek istediğimizde Python yerel uygulamaya yönelik veriler hazırlanmamıştır. Default cfg black ops 2 Effects of a retinal-specific kinase inhibitor on myopia development and its underlying mechanisms in chick and guinea fowl. Myopia, or near-sightedness, is one of the leading causes of permanent visual impairment worldwide.

Studies have suggested that abnormalities of the retinal signaling pathway underlie the aberrant regulation of ocular growth. In the present study, we treated chicks and guinea fowl with an inhibitor of

Stimulation of ATP hydrolysis and ATP-dependent association of RNA polymerase with the Escherichia coli beta-galactoside operon. RNA polymerase is stimulated to synthesize transcripts of the beta-galactoside operon in the presence of the inducer, N-beta-d-galactosyl-1-arabinose. This effect is due to an increase in the rate of phosphoryl transfer from [gamma-32P]ATP to the enzyme and is accompanied by the appearance of an increased steady-state level of RNA polymerase that is bound to DNA. The increased rate of phosphoryl transfer is reflected in the increased rate of conversion of [gamma-32P]ATP to c-AMP and is accompanied by an increase in the activity of c-AMP phosphodiesterase. In the presence of the inducer, the rate of conversion of [gamma-32P]ATP to c-AMP is decreased by RNA synthesis inhibitors; actinomycin D and rifampicin. Ethidium bromide, an inhibitor of transcription, increased the rate of conversion of [gamma-32P]ATP to c-AMP. These effects are interpreted to mean that a fraction of RNA polymerase molecules can proceed to termination without dissociation from the initiation site. This class of RNA polymerase is inhibited by both actinomycin D and rifampicin, the latter agent more effectively./\* \* Copyright (c) 2007-2008, Steve Springett \* \* All rights reserved. \* \* Redistribution and use in source and binary forms, with or without \* modification, are permitted provided that the following conditions \* are met: \* \* \* Redistributions of source code must retain the above copyright \* notice, this list of conditions and the following disclaimer. \* \* Redistributions in binary form must reproduce the above copyright \* notice, this list of conditions and the following disclaimer in the \* documentation and/or other materials provided with the distribution. \* \* Neither the name of the University of Southern California nor the d4474df7b8
