Your question should've been "Can I get a particular voltage from AC mains?" Can we get a 10V DC from 10V AC mains? Can we get a 100V DC from 100V AC mains? Would the power curve be a straight line? Would it be a triangular curve? Also, will the flyback diodes have enough current capacity to handle a 10kV spike? Yeah, it doesn't sound like a full-blown power supply. Someone or some project with your batch would put together a circuit that would do that job. Or you could do it with a commercial inverter. But I'd suggest taking the AC into a transformer. The simplest is a bi-wye but a ydc with the bi-wye and then a diode bridge at the secondary. Then you'd have a 10 VDC supply. But this is getting into Big Boy stuff. I expect that Joe Blow will be much more enthused with the project if it has multiple outputs instead of one. One of those flat-pack voltmeters, for example, would do nicely. Nope, that would be peak power out, which is the same whether you have a power supply or a transformer or an engine starter. I'd be surprised if you could get any significant power from one quarter-watt converter. By "significant" I meant 10 watts or more. The point of a power supply is to deliver large amounts of power to loads. Once you have a power supply, there are other things you can do with it besides. I'm not trying to be difficult. Can I get a 10V DC from 10V AC mains? No you can't. Why not? Because the 10V is the result of the AC/DC conversion process. The DC voltages get smaller the higher the frequency. In your case, 10V could only come from 13.8V at 110Hz, which is well over your 10V peak speed.

Your question should've been "Can I get a particular voltage from AC mains
