Regular Polygon Area Calculator Crack + Keygen For (LifeTime) 2022

Area calculator: Calculate the area of a regular polygon (a triangle, square, pentagon, hexagon, heptagon, octagon, decagon, etc.) in the most efficient way. The program works as follows: Select a polygon shape. Specify the number of sides of the polygon and the exact side length. Calculate the area of the polygon and display it. Features: - Handles all kinds of regular polygons - triangles, squares, pentagons, hexagons, heptagons, octagons, decagons, etc. - Ability to calculate the area of regular polygons by the geometric formula (taken from MathWorld) or the programmatic formula (taken from Wikipedia). - In-built functions for calculating the perimeter and center of a polygon, and to find the angle between two points. - Has an option to calculate the area of a polygon by the formula: $a^2 / (b^2 - a^2)$ - Ability to save results to a text file (this may take time to complete) - Allows you to check your answer with a math-proof (a strong foundation for your mathematics skills). - Comes with a built-in help file. Download Regular Polygon Area Calculator Full Crack and enjoy free space-saving Java-based software for calculation of regular polygon areas. Techsupport's Favorite Software Ruler and Compass is designed to measure distances and angles. This utility is useful to teachers, students, engineers, architects, surveyors, computer programmers, drafting artists, etc. This is not a program for calculating geometrical shapes or calculating complex functions. Some of its features include: - Allows you to add, subtract, multiply, divide, and convert numbers. - Has a precision to tenths of a percent. - Multiplies, divides, adds and subtracts from distances and angles. - Shows whether a number is even or odd. - Shows whether a number is even or odd. - Shows whether a number is even or odd. - Shows whether a number is odd or even. - Calculates distance from one point to another. - Shows the distance from one point to another. - Calculates and shows the length of an arc or a segment. - Calculates and shows the length of an arc

Regular Polygon Area Calculator Free

Number of Sides - input the number of sides of your polygon Side Length - input the exact length of a side If you have any questions, feel free to contact me through my profile or email (user@knight.net) or find me on IRC (nick: jake#roseville.freenode.net) or DALnet (Nickname: c0s2) and ask me. Download Polygon Area Calculator: Comments so yeah i'll take that last post as constructive criticism for the sake of the community. anyway, there's no reason why you would have to send your polygon to be calculated, you can use the formula you gave me and just calculate the area yourself. I've been working on a very basic (not that I'm complaining) editor and overall it works like this: 1. You enter a polygon in here in the form: (N,0),(N,S),(0,S) 2. The editor automatically splits the polygon up into X X X rectangles (N is the number of sides). 3. The user can drag and drop the rectangles to change the number of sides and rectangles. 4. The user can also see the number of sides and the area of the rectangle. 5. The user can click and drag to generate the area of the rectangle and then it automatically goes into a calculator to show the area of the original polygon. I just wanted to see if this was too "unorthodox" a method to calculate the area of a polygon. I'll look into the compiler error and see if I can fix it. Thanks! 0.4.2b Fixed compiler errors Added file save and load function A little bigger this is what I have so far I haven't programmed before (I don't even know how to program) but hopefully this is the right way to go about the calculator. This is my first program in Java. When I get more experience I'll start using if statements but this is what I came up with for now. ... In any case, my example is a little too long to post here, but it's a fairly straightforward one. I'd really appreciate feedback on the code, the design, or any other aspect 77a5ca646e

The program calculates the area of a regular polygon with given sides. Screen Shots Use JButton btnCalc to show the input form and calculate the area. About the output, the value is given in units of m2. The input is accepted as is. The program will work properly on the computers with the operating system of the PC and Java Development Kit 1.5 or higher. Homepage: Software format and distribution license: GNU GPL v3.0 The latest version of the software will be found here: Bugs: None. Contact: Contact me at the address: qiuyang_calc@yahoo.com or

What's New in the Regular Polygon Area Calculator?

PolygonAreaCalculator is a simple and useful Java-based polygon area calculation application. PolygonAreaCalculator allows you to determine the area of your polygon by entering the number of sides of the polygon, its side length and the desired area of your polygon. This application is a simply Java-based application that can be downloaded for free. For more information about this application, contact: Data Source: See also: Welcome to the Forum Archive!
