PSD (Photoshop Document) The PSD is a format that is created by Photoshop. It is a collection of layers that appear in a single document, just like a page in a print book. The PSD and its version, PDF, are designed to work with Photoshop and the latest version of that software. PSDs are generally the main layout of a photograph, illustration, or graphic design. (See Figure 5-12 and keep track of everything you create \(\right\) in the Photoshop workspace.") for an example.) Because a PSD is layered, it supports transparent layers. This means that a single layer can be designed or text written on the top layer and the design on a layer below it, allowing both to exist as one complete image.

The PSD files generated by Photoshop are exported in a standard 12-bit color space, which is referred to as RGB. Any other color space you find might or might not be true color, so be careful when using it in graphic design. RGB is a color space that contains all of the colors that can be represented by the three primary colors of light, red, green and blue. Its best attribute is the reproducibility. You can reproduce the colors of anything represented in RGB at any time using only the three primary colors of light. However, RGB is also the most limiting of the three color spaces as colors can't be represented in it outside of those three colors of light.

This limits the ability of the color space to correctly represent a wide range of hues and colors. The best color space is CMYK because it represents all of the colors that can be represented by the four secondary colors, cyan, magenta, yellow and black. However, the downside of using CMYK is that an RGB image can't be reproduced in all four colors. Choosing an Adobe RGB color space is the best choice for print or for most web pages as it has a better representation of a wide range of colors. It's also the default color space used by many photo editing programs, graphic design programs, desktop publishing programs and other applications. 1. Field of the Invention The present invention relates to display of images on the retina of the eye, and more specifically to methods and apparatus for displaying stereoscopic or multiple image and depth information in such images to the retina. 2. Description of Related Art Displays for the retina include photochromic display devices, such as described in U.S. Pat. Nos. 4,141,420 and 4,232,098, which are constructed of aligned apertures or slits that pass light or other electromagnetic radiation, such as electroluminescent light. Such displays can be fabricated by a process disclosed in U.S. Pat. No. 4,141,420. In addition, displays can be constructed from a luminous material that exhibits a phase change from an opaque state to a transparent state, such as cholesteric liquid crystal displays as described in U.S. Pat. Nos. 4,959,760, 4,863,772 and 5,451,820, and by U.S. Pat. Nos. 5,159,428 and 5,184,856. Other conventional approaches to eye-mounted displays for stereoscopic or multiple image and depth information include lenticular lenses, holographic images, anaglyph (red-blue) images, parallax (parallel slit) images, and autostereoscopic displays. Conventional microdisplay display technology can be grouped into two categories: displays that are viewed directly through a system of apertures or slits and displays that are viewed through a lens. One of the advantages of displays that are viewed through a system of apertures or slits is that they are inherently more compact, and in some embodiments, can be viewed with a direct line of sight through the display aperture without the need for refocusing. Displays that are viewed through a lens can typically be viewed in a wider range of head positions than displays that are viewed through a system of apertures or slits. However, a problem with displays that are viewed through a lens is the loss of resolution due to the limited range of field angles and the decrease in sharpness of the displayed images or depth information as the field angle increases. Displays that are viewed through a lens can also suffer from decreased visual acuity. A person may view a display that is viewed through a lens when the eyes are not focused on the image. This can result in images on the display that are out of focus. Some conventional

A great number of inhaler devices for applying medicine or other components to the lungs are known. For the inhalation therapy, pre-mixed solutions of aerosolized medicine (e.g. beta-adrenergics and anticholinergics) in a base substance (e.
