Alberta's oilsands have become some of the most controversial projects in the world today - their potential to cause severe destruction to an ecologically fragile ecosystem is widely known, but it has taken years of public involvement, lobbying and legal battles to affect policy and to change the industry. The International Energy Agency estimates that eight million barrels of oil are being drained from Alberta's oilsands each day. Officials are rushing to drain as much as they can now, before new safety standards are implemented in 2017. As a result, we know little about how the industry is impacting the Northern Alberta landscape. A new study by the University of Alberta, in collaboration with the University of Calgary and the University of Ottawa, uses satellite images to show how the development of Alberta's oilsands has transformed the landscape. "We found the landscape has been dramatically changed," said Tom Pugh, an associate professor in the Department of Geography at the University of Alberta. "The environmental impacts have changed and we are seeing them today." A major portion of the oilsands is in one specific area of northern Alberta, known as the Athabasca oil sands. The region is located in the foothills of the Rocky Mountains, and would be considered part of the boreal forest in some other jurisdictions. The study analyzed the extent and appearance of boreal vegetation in 2011 and 2016, which was used as a baseline for the calculation of changes to the landscape in just one year (2016). A plot of satellite images, showing some of the areas examined in the study. Credit: University of Alberta The data was combined to produce a composite image of the landscape, highlighting the differences in the amount of boreal tree cover since 2011. The data clearly shows tree cover has decreased in the Athabasca area, while it has increased over the rest of the landscape. The study was published in the journal Nature Climate Change. "This is the first of its kind to be published," said Tyler Sanders, a former Ph.D. student at the University of Alberta. "The results are interesting because it gives a good indication of how much land was impacted, and how much was impacted by oil industry activity." Pugh said his study shows the oil industry's impact on the environment has been underestimated. Although the development of the oilsands is widely known as a dangerous process, it is also one that is

Art Brushes Art Brushes allow you to draw and paint objects in an image using any type of drawing and painting tools. They come in a variety of shapes, sizes, and colors, allowing you to create your own brushes or select from a wide variety of brushes already built in the program. Your brushes appear in the Brushes palette after you have selected them from the Art Brush panel or used the Brush tool in the toolbox. When you're using the Brush tool, it displays the Art Brush palette in the default color palette. (You can change the tool's palette color at any time.) Art Brushes are different from the built-in Photoshop brushes that come with the program. The built-in brushes use the exact shape of the tool icon, which you see in many places in the Toolbox, but they do not follow the exact color and shape of the brush itself. You can create your own Art Brushes, then select them from the Art Brush palette.
