Gene therapy as a breakthrough in the treatment of cardiovascular diseases. The usefulness of gene therapy for a variety of diseases has been tested in many experiments in animal models and in clinical trials, and this technology has entered the stage of research and commercial development. Currently, gene therapy is in the stage of clinical studies of cardiovascular diseases such as ischemic heart disease and heart failure. As cardiovascular diseases are major causes of death worldwide, development of a new, highly effective treatment for cardiovascular diseases is required. One of the significant features of this field is that almost all the basic research on gene therapy has been performed using animals. Gene therapy for cardiovascular diseases has three targets: 1) ischemic disease, 2) heart failure and 3) gene therapy for peripheral arterial disease. Among these diseases, gene therapy to increase cardiac contractility is already under clinical investigation for heart failure, and adenovirus-mediated gene therapy has been tried for ischemic disease. In addition, a novel therapeutic approach such as gene therapy for peripheral arterial disease is also under study. Gene therapy for ischemic diseases may be first introduced in practical use in the near future. some questions you might want to ask before you enroll them in college: What are your grades? Can you pay for college? Can you handle the responsibility? Have you ever been in trouble with the law? What are your plans after college? Are you prepared to take on the responsibility of a family?
