So feel free to ask anything about my queries. A: StringBuilder has a constructor that takes a StringBuilder, and sets the value of that StringBuilder to the concatenated string. The String.Format() method takes a StringBuilder as a parameter, and therefore can append to it. The Castaways (comics) The Castaways is a 1984-1989 black-and-white British graphic novel created by John Smith and Chris Welsby and published by Alan Cowsill Ltd. The storyline is set in Fordingbridge, Hampshire and the story is loosely based on the 1885 novel The Children of the New Forest. Characters Rollo ("Rob") Warwick is the half-brother of the King and an old friend of The Professor. His main objective is to have the castaways from the book back in some sort of order. He is implied to have broken the vow he took in 1845 when he agreed to restore the curse on Bathsheba and to wait until the order was restored in order to turn his back on people who had suffered under the curse. The Professor ("Prof") Winchester is Rob's friend. He is a traveller and inventor who has been through many adventures, and has made a fortune from the sale of his latest invention, the "Wishing Well", which can grant any wish. Although strong-willed and opinionated, The Professor is usually reasonable and fair-minded. However, he is also usually annoyed at the behaviour of other characters, such as Bathsheba and Rollo, when they refuse to cooperate with him. Bathsheba was the original castaway of the 1885 story, and is now married to Rollo. She has a tendency to waver on her decisions, and appears to be infatuated with Rollo. Although she maintains that her affair with Sir Myles Standish in the late 18th century caused the curse that killed her husband and child, she is currently in love with Rollo. Abraham Sacchus is a rich and foolish individual who wears a suit of armour and has a few servants, horses and cows in his yard. He is also supposed to be an ancestor of the Warwick family. He also has a dog named Bucephalus who is the subject of many comic strips, and is regularly beaten by Abraham to prevent it from eating the rabbit that the Professor has left for him. Daphne is the daughter of Abraham

ItalianoThe present invention relates to a clamping device and more particularly to a new and improved clamping device for flexible tubes used in medicine, such as ureteral stents. Ureteral stents have been used for many years to protect a patient's ureter during surgeries where the ureter is cut. Such ureteral stents are inserted into the ureter and function as temporary urinary conduits. A loop of stent material can be looped around the ureter just below the renal pelvis. After the surgery the stent is pulled out of the ureteral lumen and through the urethra and the penis of the patient to retract back into the urethra through the skin. Thereafter, urine flows through the stent and out of the patient's body. These stents have proven to be a very reliable and inexpensive means for supporting the ureter until it heals, or is able to heal.

The stent materials employed for ureteral stents, such as silicone and polypropylene are commercially available and are fairly flexible. However, when such stents are clamped, they are somewhat inflexible and may crack.

Moreover, most of the commercially available stents are inelastic and therefore require a physical clamping of the stent to press it into a permanent shape. An additional problem with current stent materials is the inability to change the shape of the stent into a body lumen once the stent has been

clamped. Although the currently used stents are inelastic and have no memory, they cannot be changed in size once clamped. That is, they can be expanded only in diameter. Clamping devices have been developed in other fields as well. U.S. Pat. No. 4,596,573 to Thomas discloses a vascular clamp.

The disclosed clamp is applied to a blood vessel and placed in an occluding position. The blood vessel is then clamped down into a permanent shape. The clamp is then removed and the clamp is opened. This clamp, however, is not designed to deform flexible tubing but rather rigid tubing. U.S. Pat. No. 4,590
