In addition to the Adobe Photoshop CS6 program, Adobe makes Photoshop Elements, which is similar to Photoshop, but less expensive, and Photoshop Express, which is more free-form. Photoshop is available for several platforms, including the Mac OS, Windows, and Linux. Photoshop is a registered trademark of Adobe. Creating Your Photo Essay An essay is a narrative composition that holds the reader's interest. In an image that serves as a photo essay, you try to make all the elements in the image do just that. The subject matter is an extreme case of a photo essay. In this section, I give you a checklist of things to do when composing a photo essay. These aren't mandatory items, but they're good to have when composing a photo essay. Following the list I provide in the following sections, you decide how you want to present this image — that is, which images are featured in the photo essay. If you're not sure how to proceed, check out "Using Titles, Captions, and Descriptions," later in the chapter. Working with the main subject One of the key elements in creating a photo essay is the main subject, the person or thing of interest that the photo essay is about. This doesn't mean that you can't do a photo essay about anything. It means that you must find the main subject, or person, and that subject needs to be front and center. Have you noticed how many photo essays are about love? There's the story of the couple falling in love, the story of the couple separating, and the story of the couple getting back together. Few photo essays can successfully ignore the bottom line: love. The success of a photo essay relies on the main subject. You can have a compelling story, but if the subject is boring, you run the risk of losing the reader. Conversely, if the subject is interesting but the shots don't tell the story or don't work, the photo essay loses traction. In the following example, I show you how to choose a subject for a photo essay. Notice how I'm using a two-step process. First, I let the subject do the talking. I let the subject tell me what story to tell. Then I ask the subject a few simple questions: Do you want to talk? How do you want to be portrayed? (You may want to explore these questions with your subject first.) If you

Controlled digestion of CdSe/ZnS core/shell quantum dots for quantification using FIA. This study describes the application of a controlled digestion method in the digestion of cadmium selenide and zinc sulfide core/shell quantum dots (QDs) for the quantification of the QDs using flow injection analysis. To achieve controlled digestion, various amounts of hydrochloric acid and hydrogen peroxide were mixed at different intervals. The limit of detection (LOD) and limit of quantification (LOQ) are 0.09 and 0.25 µg/mL, respectively. Good linearity was found for the calibration curves in the ranges of 0-0.50 µg/mL ($r(2) = 0.991$) and 0.50-1.00 µg/mL ($r(2) = 0.991$) for cadmium selenide and zinc sulfide QDs. The recoveries obtained by the standard addition method were ranged from 94.67 to 100.66% at the 3 different levels of QD concentrations. The proposed method is simple and fast. Sterilization of food is necessary to inhibit the growth of bacteria or other harmful microorganisms, either prior to sale and/or packaging of the food, or after sale and/or packaging has occurred, to inhibit recontamination and spoilage of the food. Many types of food are sterilized before being packaged, such as cheese; however, even after packaging, the quality of some types of food can be adversely effected by exposure to oxygen, such as cheese, because such a product loses its flavorful characteristics and the mold and other fungi may develop and grow.

Remediation and maintenance of dilute aqueous solutions of the herbicide 2,4-dichlorophenoxyacetic acid, a commonly used selective herbicide. In water, herbicide 2,4-dichlorophenoxyacetic acid (2,4-D) exists as both the acid (3:1, molar ratio) and the salt (1:1, molar ratio). The toxicity of dilute 2,4-D solutions is highly dependent on the chlorine to 2,4-D concentration ratio (molar ratio). The physical and chemical mechanisms for 2,4-D (acidic) removal from aqueous solutions, the stability of 2,4-D during storage, and the degradation and transformation products of 2,4-D have been examined. Rapid removal of 2,4-D from dilute (20 ppm) aqueous solutions by filtration through a glass fiber or polyvinyl chloride (PVC) filter was examined. Thirteen percent (v/v) methanol was the most effective vehicle for removal of 2,4-D acid from aqueous solutions, and sulfamic acid was the most effective mineral acid for degradation of 2,4-D acid. 2,4-D is stable in the presence of sulfamic acid, but is not well removed by filtration with methanol. Removal of 2,4-D from solutions stored for 1 mo at 25 degrees C was excellent. Ortho-toluidine, 2- and 3-chlorophenoxyacetic acids, 4- and 5-chlorophenoxyacetic acids, and 2- and 3-monochlorophenoxyacetic acids were the major transformation products, and the formation of these metabolites was similar to that of 2,4-D acid. In the absence of sulfamic acid, the major transformation product of 2,4-D was formed by cleavage of the glycosidic bonds in the carboxylic acid moiety. 2,4-D is also relatively stable in aqueous solutions containing 2,4-D acid and in solutions containing both 2,4-D and 3,4-D acid.
