### What's New in the?

Show HN: Go from full notebook to DOM tree - jpswade ===== jpswade I needed to collect some data about product pages and the way people worked with these pages, but didn't want to dig in to the templates and HTML. I thought an excel spreadsheet was too messy but wasn't keen on scribbling on sheets and the like. I know HTML so I wrote my own library to transform spreadsheets into DOM trees that could be inspected and manipulated in React/Vue/Angular. I've been using this for a while and love it. It's hopefully useful to some people so I figured I'd share. I could use some help with testing and especially improving the way images are processed but I'll add that to a PR. // Copyright 2016 The Go Authors. I need to query for the latest record for each customer. i.e. List of products for customer 1 is [ 1. Product A, 2. Product B, 3. Product C]. for customer 2 I would like the list of products to be [ 1. Product A, 2. Product C] So I need this list based on 'customer' and 'type'. I thought this should work as it worked in SQL Server but doesn't seem to be working in MySQL. SELECT \* FROM products pr JOIN product.products\_type pt ON pt.id = pr.type\_id JOIN customer.
