Pseudocolor Download For PC

===== Pseudocolor is a virtualDub filter in the form of a ``.reg`` file. It is meant to be uploaded to the global ```FILTERINFO``` registry by the user, using the VLF.

Pseudocolor will probably be one of the first filters added to the ```FILTERINFO``` registry; thus, it would be helpful to describe its operation in a bit more detail than would be necessary for any other filter. Pseudocolor will, by default, use a simple linear mapping between the input and output pixel values. The Pseudocolor filter calculates the luminance of the output pixel as the sum of the values of the input pixels. It then finds the index of the palette entry whose luminance is closest to the calculated luminance, and uses the corresponding RGB value from that palette entry as the output pixel value. In order to prevent integer overflow, Pseudocolor allows the palette entry's RGB values to be of any type. However, we recommend that users include an appropriate clamp function in their palette files to ensure that integer overflows will be handled appropriately. The color palette files provided with the Pseudocolor filter are designed for use in viewing grayscale clips. Each palette file is a text file defining RGB value pairs of the form ```#rrrr``` where the `#r` is the red component and the `#g` is the green component of the value. Example pseudocolor palette files: ```palette-sherwood.reg``` ```palette-stevens.reg``` :: If the user wishes to generate their own pseudocolor palette from scratch, we recommend that they download the FractInt package from [and use its palette utility, ``palette.py``](#). The Pseudocolor filter is invoked using the following syntax: ```install.cmd install.pl install.lib install.reg vlf.lib vlf.reg``` ```install.pl``` `install.lib -----` The ```install.pl``` script will install the Pseudocolor filter into the ```VHOST```, ```VFILTER``` and ```VSEARCH``` directories of the current working directory, and in the GLOBAL ```FILTERINFO``` registry. :: (First line of the
