PowerPoint Microsoft PowerPoint has been a staple for powerpointing presentations and preparing business materials for a long time. Even before the PC, Microsoft was a huge player in graphics software and design. They developed PowerPoint in the mid-1990s to provide a faster and more interactive way to create presentations. PowerPoint's most obvious change is the switch from a DOS-based UI to Windows. Its name is different from the company's name and Microsoft Office is its name, but it is also the standard for graphics on the Microsoft Web site. When Microsoft first introduced PowerPoint to

Photoshop Elements 11: History, Guided Fixes, Collections and more Photoshop Elements 11 brings many innovative features that make it a professional's editor. These include several new editing tools, such as the Guided Fixes tool, the Content-Aware option, and an object removal tool. Other features include the introduction of a History panel that lets users see changes made over time, create slideshows, and convert to 16:9 and 4:3 aspect ratios. There's also a professional workspace with new zoom levels and canvas treatments. You can use the Content-Aware feature to eliminate unwanted objects, such as hair or hatbrims, or items in photos that were not captured in the image. However, there's a fair amount of guesswork involved in determining exactly what should be removed. Content-Aware doesn't automatically remove hairs that look like they belong to the head, or hats that seem like they came from a head in the image. Do you like the new Photoshop Elements 11? Alor, a graduate from University of Illinois Urbana-Champaign, was one of the first people to become a member of the virtual currency community after bitcoin was created in 2008. The currency has seen explosive growth since then, especially after Fidelity Investments acquired a high percentage of bitcoin in December. Within the past few weeks, demand for the digital currency has skyrocketed, with the price of a bitcoin now reaching as high as $759. The project began in 2008 and was designed by anonymous developer Satoshi Nakamoto. The currency's decentralized payment system was meant to serve as an alternative to traditional currency. Zebpay is a Bitcoin company that was founded in the UK in 2012 to facilitate the buying and selling of Bitcoin, a digital form of currency. The unit is a significant milestone for the digital currency industry in India. These initiatives could ultimately lead to bitcoin becoming an Indian currency. Minesar, a graduate from Delhi's Indian Institute of Technology, has been mining bitcoins on his personal computer for the past few months. His presence in the Bitcoin community has led to official bitcoin forums in India starting to emerge, including the team's own forum and a discussion channel. Since bitcoin's creation in the early 21st century, the digital currency has experienced tremendous growth and development. In just seven years, it has evolved from a major source of financing for white-collar criminals to a complex ecosystem of its own. The digital currency is now legal tender in some parts of the world, including Japan and the UK. The overall price of one bitcoin, however, has fallen from highs of $1,242 to lows of $425 in the past month. Now, some of the world's biggest financial institutions are experimenting with the currency, including Cyprus' second-largest bank, Eurobank, in March.Possible role of low-energy electrons in damage to astrocytes in culture. Electrons can be responsible for extensive damage to cultured astrocytes during repetitive or prolonged radiation exposures. The effects of a 120-kVp electron beam on cultured astrocytes were studied by using a conventional scanning electron microscope equipped with an energy-dispersive X-ray microanalyzer. The cytological effects were graded and assessed by using a defined three-category scoring system. Electron irradiation induces astrocytic damage at intracellular and intercellular levels. Post-operative local recurrence of carcinoma of the breast: a study of 171 consecutive cases treated by radical mastectomy. A total of 171 consecutive cases of primary carcinoma of the breast treated by radical mastectomy at the University of Toronto Hospitals between 1950 and 1971 are analysed to determine the incidence of local recurrence after this kind of treatment. The crude incidence of local recurrence of carcinoma of the breast is 5.7% (9 of 171). The overall cumulative incidence of local recurrence after 5 years is 13.7% (22 of 171) and after 10 years is 21.8% (35 of 171). There is no difference in the clinical and pathologic parameters between patients with and without local recurrence. Overall survival was 0.83 after 5 years and 0.74 after 10 years in patients with recurrence and 0.85 after 5 years and 0.84 after 10 years in those who were free of disease.1. Field of the Invention This invention relates to the mining of metals and more particularly to a magnetically-actuated collection apparatus for separating fines from waste rock. 2. Description of the Prior Art With the ever-increasing price of minerals, it is becoming increasingly more difficult to find a cost effective method of extracting, concentrating or economically processing mineral ores to make them more easily usable for the manufacture of desired articles. The mining of mineral ores is also being performed in countries, which do not have the infrastructure necessary to process the mined materials for economic utility. In either instance, however, the cost of the development of additional mining and processing methods is a significant concern. An effective solution to this problem would entail a method of transforming waste rock to an ore product to be more easily processed at a second site away from the mine. It is known in the mining art to use a magnetic separator to separate metal ores from other ores or undesired materials. Magnetic separators generally include magnets of alternating polarities that tend to attract magnetically-active material.

Particles that are attracted by the magnets sink to the bottom of the separator where they may be removed by conventional means. Typically, the magnets are mounted on the inlet end of a vessel which is usually lined with a ferromagnetic material, such as steel, to prevent the movement of ferromagnetic material, such as ore, through the separator. In addition to ores, sands, rocks and other earth material can also be magnetically separated. It is also known in the
