Steroid hormones are involved in many physiological processes. Due to the large number of steroids now being synthesized it is a necessity to measure their levels in biological fluids, and also to determine the molecular forms for each of these compounds. A relatively new method has been developed to separate and quantitate the major isomers of 21-hydroxysteroids. This chromatographic method is based on two-dimensional thin layer chromatography. This technique consists of two-dimensional thin layer chromatography performed on silica gel. The sample that has been analysed using the above technique is extracted into chloroform prior to chromatographic separation. The various steroid derivatives are then separated on a silica gel/cyclohexane three-dimensional chromatogram. This technique is reliable, efficient, and rapid. This invention relates generally to mobile communication, and more particularly to improving the bandwidth available for transmitting and receiving signals in a mobile communication device. Wireless communication devices typically rely on radio communication between a wireless base station and a mobile communication device. To avoid interfering with other wireless communication devices, the transmitting and receiving powers are typically kept to low levels. As the development of wireless communication technologies, modern wireless communication devices now may have several wireless interfaces to communicate with several wireless communication systems having different capabilities. For example, a wireless communication device may have a wireless interface for communicating with the Global System for Mobile communications (GSM) system, a wireless interface for communicating with the General Packet Radio Service (GPRS) system, and a wireless interface for communicating with the Universal Mobile Telecommunications System (UMTS). An emerging technology for mobile communication is Orthogonal Frequency Division Multiplexing (OFDM). Multiple access schemes, such as time division multiple access (TDMA), frequency division multiple access (FDMA), and code division multiple access (CDMA), are used in the OFDM wireless communication system
